Final Exam 2015

Prescription Number: COSC428

Paper Title: *Computer Vision*

Time allowed: TWO hours

Number of pages: 5

- This exam is worth a total of 100 marks
- Contribution to final grade: 40%
- Length: 10 questions
- Answer *all* questions.
- Calculators are *not* allowed.
- *This is a closed book test*.
- Use the separate *Answer Booklet* for answering *all* questions.

1 (12 marks total)

Briefly describe advantages and/or disadvantages of the following four different types of camera technologies **for acquiring image depth values**. [1 mark for each advantage *or* disadvantage cited]

(a) structured light camera [3 marks]
(b) time-of-flight camera [3 marks]
(c) stereo camera [3 marks]
(d) LIDAR (Light Detection And Ranging) [3 marks]

2 (8 marks total)

a) **Spectral Resolution**. Humans can perceive 10 octaves of sound frequencies, from 20Hz to 20kHz. State the approximate spectral resolution (wavelength in nm) that can humans perceive. [2 marks]
b) **Dynamic Range**. The difference in intensity between the softest perceivable sound and the loudest sound that can be tolerated without pain is a ratio of 10^9:1. State the approximate visual dynamic range (as a ratio) that humans can perceive in regards to the difference between the lowest perceptible light intensity and the highest intensity we can tolerate without glare. [2 marks]
c) **Spatial Resolution**. State the approximate number of centimetres spatial resolution that humans can perceive at 20 metres. [2 marks]
d) **Radiometric Resolution**. Regardless of our spectral resolution and dynamic range, most humans can only reliably distinguish between a limited number of colours and shades of grey. State the approximate number of colours and the approximate number of shades of grey that humans can reliably distinguish between. [2 marks]

3 (7 marks)

The Hough (pronounced "huff") transform (HT) can detect a line using a "voting" scheme where points vote for a set of parameters describing a line. The more votes for a particular set, the more evidence that the corresponding line is present in the image. So it can detect MULTIPLE lines in one shot.

To find straight lines:

- A line in the image corresponds to a point in Hough space
- To go from image space to Hough space:
  - given a set of points (x,y), find all (m,b) such that y = mx + b

Basic Hough transform algorithm

1. Initialize H[d, θ]=0
2. for each edge point I[x,y] in the image
   for θ = 0 to 180
   $d = x\cos\theta + y\sin\theta$
   H[d, θ] += 1
3. Find the value(s) of (d, θ) where H[d, θ] is maximum
4. The detected line in the image is given by $d = x\cos\theta + y\sin\theta$

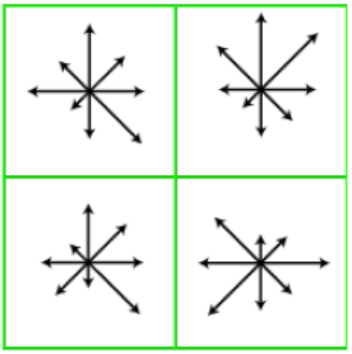
Describe how this Hough transform can be generalised to detect curved lines in an image, even when the curve does not have a simple analytic form.

4 (9 marks total)

TextonBoost is a good algorithm for segmenting textured regions in an image.
Describe the following three steps of TextonBoost: [3 marks each]

(a) convolution and clustering
(b) boosted texture layout filters
(c) alpha-expansion graph cut

5 (8 marks)



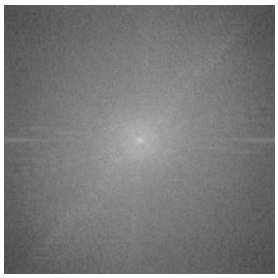
The orientation of objects can be tracked from one frame to the next using the *scale-invariant feature transform* (SIFT) which extracts scale and rotation invariant features from images. SIFT is also used to recognise objects and match different views of a scene for stereo vision. In this algorithm, descriptors of key-points across an image are created as a set of 8 gradient orientations about a pixel as shown in the diagram to the right.

What gradient operators would you use to create such a set of **eight** orientations as shown in the diagram to the right?

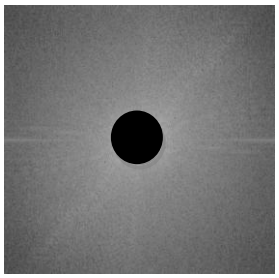
6 (12 marks total)

Images can be filtered by applying an inverse Fourier transform to a Fourier transformed image. Given the following image and Fourier transforms of that original image:

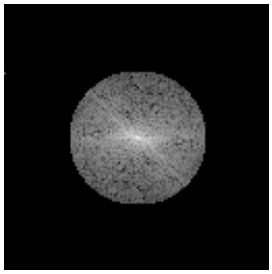
Original cheetah image



(i) Fourier transform of image



(ii) Fourier transform of image with centre blacked out



(iii) Fourier transform of image with all but the centre zeroed

(a) Is image (i) the magnitude transform or phase transform of the original image? Explain the appearance of image (i) [2 marks]

(b) If an inverse Fourier transform is applied to images (ii) and (iii), describe the resulting images and also explain why they would appear as described [4 marks]

(c) The Fourier transform is a self-inverting transform. Explain what this means. [2 marks]

(d) Describe the purpose of the main components of the following equations for a forward Fourier transform and an inverse Fourier transform in the discrete domain: [4 marks]

Forward transform:

$$f[m,n] = \sum_{k=0}^{M-1}\sum_{l=0}^{N-1} F[k,l] e^{-\pi i\left(\frac{km}{M}+\frac{\ln}{N}\right)}$$

Inverse transform:

$$f[k,l] = \frac{1}{MN}\sum_{m=0}^{M-1}\sum_{n=0}^{N-1} F[m,n] e^{+\pi i\left(\frac{km}{M}+\frac{\ln}{N}\right)}$$

7 (12 marks total)

Briefly describe the following morphological operators and explain what effect they have on an image and why they have such an effect:

(a) Erosion [3 marks]
(b) Dilation [3 marks]
(c) Open [3 marks]
(d) Close [3 marks]

8 (10 marks total)

A fiducial marker can be used to find the six degree-of-freedom (DOF) pose of a camera.
Describe the following five steps for finding this six DOF pose: [2 marks each]

(a) Fiducial marker detection
(b) Rectangle fitting
(c) Pattern checking
(d) Lens undistortion
(e) Pose estimation

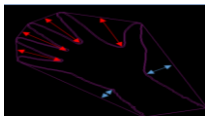
9 (6 marks)

The Bundle Adjustment algorithm can enable accurate 3D reconstruction from multiple views.
Describe this algorithm.

10 (16 marks total)

You are to briefly describe **only four** of the following 2015 class projects [for 4 marks each] by listing at least four algorithmic steps (for each of the four projects), naming the algorithms used in the order they were used. **Do not select your own or similar project** (e.g. face recognition projects do not select other face recognition projects, etc).

(i) Find outlines of textured regions using “Extendible Edge Detection for Real-time Systems”



(ii) Recognise hand poses using “Hand Gesture Recognition”

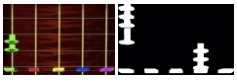
(iii) Identifying tree branches in "A Novel Approach to Tree Limb Identification"

(iv) "A Method of 3D Object Reconstruction" using photos of an object taken with a mobile phone from different viewpoints

(v) Track lines of electrical tape on the ground with “A Novel Approach to Line Extraction using Saturation Thresholding”

(vi) Recognize plate numbers that contain both Arabic and Latin characters using "Bilingual Number Plate Recognition"

(vii) Collect data from controlled intersections using a "Vision Based Traffic Light Detection System"



(viii) “Runway and note detection for the computer game Frets on Fire”
